Science Test

- 1) Food Making process
- 2) Evaporation
- 3) Plants cells have a rigid cell wall and chloroplasts for photosynthesis, while animal cells lack both. Plant cells ~~and~~ also usually have a large central vacuole.
- 4) The heart pumps blood throughout the body, supplying oxygen and nutrients to tissues and removing waste products. It ensures proper circulation and supports all body functions.
- 5) Evaporation is the process in which a liquid changes into vapour at temperatures below boiling point. It occurs at the surface and increase with heat and wind. For example,^s wet clothes dry faster in sunlight due to evaporation.
- 6) A plant cell has a cell wall, cell membrane, nucleus, cytoplasm and chloroplasts. The cell wall provides support, while chloroplast help in photosynthesis. A large vacuole is also present, which helps in storage

and maintaining cell pressure

- 7) The water cycle is the continuous movement of water in nature. Water evaporates due to heat, condenses to form clouds, ~~also~~ and falls ~~at~~ as precipitation. It then collects in water bodies and the cycle repeats continuously.
